# TAURI

Create tiny, fast and secure cross-platform native apps with the ease of VueJS and the power of the Quasar Framework

## Why choose Tauri?

You may be asking yourself why Quasar would bother to make a distribution target to compete with Electron, which is the de facto industry leader for building cross-platform apps with Javascript.

So here are 144 reasons.

If your app is downloaded one million times, those 144 MB of reasons transform into 144 TB of traffic, which is 384,000 minutes of download time at a 50 Mb/s downlink. Somebody has to pay for that traffic (not to mention electricity), so if it is you - then get ready for a 7000 USD / month Cloudfront bill.

Maybe this is a good deal for data transit via a global CDN - maybe not - but what about all of the time stolen from people who have to wait for their download to finish and the hidden costs of ownership associated with all of the electricity and physical storage used by the devices busy downloading 144 TB over 384,000 minutes?

And now, just think for one second about the flooding, melting and burning that is ravaging your planet. Can you really afford to keep on pretending that your software stack is good for both the planet and the pocketbook?

With Tauri, there are at least 144 reasons helping you to be sure that you are doing the right thing.

**Tauri is smaller than Electron.**

**Electron 147MB**

**Node Runtime**
